Mathematical psychology is an approach to psychological research that is based on mathematical modeling of perceptual, thought, cognitive and motor processes, and on the establishment of law-like rules that relate quantifiable stimulus characteristics with quantifiable behavior. The mathematical approach is used with the goal of deriving hypotheses that are more exact and thus yield stricter ...

Using forward kinematics, the mathematical model is developed to compute the position and orientation of arm based on the given human joint position. Each human joint is considered as revolute joint. Dynamics of the arm refers to the interaction between forces in the system and change of state of the system.
