BuildContext in Flutter is the part of the widgets in the Element tree so that each widget has its own BuildContext. We mainly use it to get a reference to another widget or theme. For example, if we want to use a material design element, it is required to reference it to the scaffold. We can get it using the Scaffold.of(context) method.

If a requirement fails, the condition table is not accessed. For example, requirement tells SAP to process output type ZBA9 only if the sales document is complete and does not have a credit block or a delivery block. You can create requirements with the help of an ABAP person using transaction code VOFM.
