This calculator simplifies ANY radical expressions. Example 1: to simplify $(\sqrt{2}-1)(\sqrt{2}+1)$ type $(r2 - 1)(r2 + 1)$.

Example 2: to simplify $\left(\frac{2}{\sqrt{3}-1} + \frac{3}{\sqrt{3}-2} + \frac{15}{3-\sqrt{3}}\right) \cdot \frac{1}{5+\sqrt{3}}$ type $(2/(r3 - 1) + 3/(r3-2) + 15/(3-r3))(1/(5+r3))$.

Overview. Many
algebraic expressions
contain radicals. These

Get Free Operations With Radical

radicals may contain numbers and/or variables. Some of these radicals can be simplified prior to simplifying the entire algebraic expression. The value of some radicals needs to be estimated in order to solve problems that are in a contextual format.

Get Free Operations With Radical Expressions

Well, one, we could use an exponent property here, or I guess we could call it a radical property, that if I have the square root of a times the square root of b, that's going to be equal to the square root of a times b. So in this case, a would be 0.4 and b would be 1.25, so this is going to be the same thing as the square root of 0.4 times 1.25.

Use the process of combining like terms to simplify expressions in which radicals are added or subtracted.

For terms to be combined, their radicands must be the same. As in combining monomials with variables, only the coefficients of the radicals are combined.
